

You are working in Vendorea.PartnerConnect.

Do not do broad refactoring. Do not redesign the contract. Do not rename the frozen Merchant360 intake API. This is a **short SPR-response alignment pass** based on clarifications received directly from SPR.

We now have authoritative guidance from SPR. Update the PC implementation to align exactly with it.

=====

SPR-CONFIRMED RULES

1. Transport

- Use **SFTP**
- Port is **50022**
- Do **not** upload with temp filename + rename
- Files with an open file handle will not be acted upon

1. Phase 1 interfaces

Implement/support:

- outbound XML PO
- inbound XML POACK
- inbound XML EZASNS / shipment manifest
- inbound invoice / credit memo
- daily inventory feed
- web service stock checks

1. ERROR acknowledgements

- You must support **ERROR acks**
- ERROR ack contains the original order as sent
- translation error message is appended to the end/bottom
- if an ERROR ack is received, the order was **not processed**
- this must produce an actionable failure state

1. XML file rules

- **1 PO per file**
- **1 POACK per file**
- do **not** send batched XML POs
- **1 EZASNS shipment file = 1 order shipment**
- **1 order may have multiple shipments**
- invoices / credit memos arrive as a **large batch XML file** containing many invoices/credits

1. Correlation

- primary correlation key is **PO number**
- if PO number can be reused, use **PO number + Dealer Attention**

1. Web services

- all are active for Gemini
- DealerStockCheck returns dealer-specific pricing
- ZIP/drop-ship inventory lookup is available

- credentials are provisioned separately by SPR helpdesk
1. Schemas
 - use the provided documents/XSDs for validation
 - but schema handling must account for ERROR ack processing
 - do not assume only "successful" ack shapes exist

=====

YOUR TASK

Perform a focused alignment pass on the PC side.

=====

A. TRANSPORT ALIGNMENT

1. Verify the SFTP transport abstraction supports:
 - configurable port
 - port 50022
 - direct upload without temp/rename workflow
 1. Remove or disable any SPR XML transport behavior that assumes:
 - FTP temp prefix
 - rename-after-upload
 - XML batch file submission
 1. Update transport configuration/docs/examples to reflect:
 - SFTP
 - non-standard port 50022
 - no temp rename pattern
- =====

B. OUTBOUND PO RULES

1. Enforce **one XML PO per file**
 - if there is any batching support in the SPR XML outbound path, disable it for SPR XML transport
 - keep any generic future batching abstractions out of the active SPR XML flow
 1. Validate that outbound generation still conforms to the existing SPR XML structures/XSD approach
 2. Ensure outbound file creation and document tracking clearly assume:
 - one PartnerConnect order
 - one outbound SPR XML PO file
- =====

C. POACK / ERROR ACK HANDLING

This is the most important change.

1. Add explicit support for **ERROR acknowledgements**
2. Treat ERROR ack as a distinct processing path from a normal successful POACK
3. When an ERROR ack is received:

- store the raw returned document
 - capture the appended translation error message
 - mark the order/document as **not processed by SPR**
 - create a canonical failure/rejection state
 - preserve enough detail for support and M360 display
 - surface a normalized actionable error back to Merchant360
1. Do not assume all POACKs validate exactly like successful ack XML
 - if schema validation for ERROR ack requires a separate handling path, implement it
 - do not silently discard ERROR acks because they do not fit the success schema perfectly
 1. Add tests for:
 - successful POACK
 - ERROR ack with original order echo + appended message
 - correct canonical status mapping
 - correct M360-facing failure payload generation

=====

D. SHIPMENT / EZASNS ALIGNMENT

1. Verify the shipment pipeline supports:
 - one shipment file = one shipment for one order
 - one order = multiple shipment files over time
1. Ensure correlation model supports:
 - one order
 - many shipment events
 - many tracking numbers / cartons over time if applicable
1. Add/confirm tests for:
 - multiple shipments for one order
 - shipment correlation by PO number

=====

E. INVOICE / CREDIT ALIGNMENT

1. Treat invoices and credit memos as **XML**
2. Support inbound **batched invoice/credit XML files**
 - one inbound file may contain many invoice/credit documents
 - split/process/correlate internally as needed
1. Confirm parser/orchestrator supports:
 - batched inbound XML
 - per-invoice/per-credit correlation
 - PO-number-based linking where possible
1. Add or confirm tests for batched invoice file ingestion

=====

F. CORRELATION RULES

1. Make PO number the primary correlation key for SPR document chain
2. Support secondary correlation using:
 - PO number + Dealer Attention
when PO reuse is possible
1. Review canonical correlation logic and ensure these fields are preserved through:
 - intake
 - outbound generation
 - POACK parsing
 - EZASNS parsing
 - invoice processing
 - M360 update payloads
1. Update documentation to make these correlation rules explicit

G. WEB SERVICES ALIGNMENT

1. Confirm/document that all SPR web services are available
2. Highlight DealerStockCheck as the service that returns dealer-specific pricing
3. Highlight ZIP-based inventory lookup as available
4. Do not build major new features here unless needed immediately
5. Just update docs/config assumptions and note where credentials will plug in

H. M360 UPDATE CONTRACT IMPACT

Without changing the frozen M360 intake contract, make sure downstream normalized updates can now express:

- order acknowledged
- order failed due to translation / ERROR ack
- partial/multi-shipment progression
- invoiced / credited from batched XML

Do not expose raw SPR XML back to M360.

Keep updates canonical.

I. DOCUMENTATION / RUNBOOK

Update or create a short SPR execution note covering:

- SFTP port 50022
- no temp rename
- one PO per file
- one POACK per file
- one shipment file per shipment

- one order can have multiple shipments
- batched invoice/credit XML
- PO number primary correlation
- ERROR ack behavior and handling

J. TESTING

Add or update tests for:

1. one PO per file enforcement
2. ERROR ack processing
3. multiple shipments for one order
4. batched invoice XML ingestion
5. PO number correlation
6. PO number + Dealer Attention fallback correlation if supported

OUTPUT FORMAT

Before making changes, show me:

- A. exact files/services/parsers/orchestrators to modify
- B. which of the above SPR-confirmed rules are already satisfied
- C. which are not yet satisfied

Then implement.

After implementation, show me:

1. what changed
2. how ERROR ack is handled end-to-end
3. how one-order/multi-shipment is handled
4. how batched invoice XML is handled
5. tests added/updated
6. build/test results
7. any remaining assumptions or items still waiting on live SPR test credentials
