

Scope this pass as **ERROR ack + transport first**, but include the **minimal real end-to-end path wiring** needed to verify it.

Do **not** attempt full A–J in one pass yet.

Scope for this pass

1. Make the live outbound SPR XML flow real:
 - canonical PurchaseOrder -> outbound EZPO4 generation
 - one PO per file
 - SFTP transport send
 - configurable port with SPR default/config support for **50022**
 - no temp-name / rename behavior in active SPR XML flow
2. Implement **ERROR ack** handling as a first-class path:
 - distinct from normal POACK
 - store raw returned document
 - extract/capture appended translation error text
 - mark order/document as **not processed by SPR**
 - create canonical failure status suitable for M360
 - do not silently discard ERROR ack if strict XSD validation fails
3. Resolve duplicate implementation ambiguity:
 - treat PartnerAdapters/SPR/Xml as the authoritative live path
 - inspect callers/DI/tests
 - retire or delete duplicate legacy implementations under Infrastructure/SprContent if they are not the live path
4. Use real SPR schemas where available for standard docs, but do **not** block ERROR ack support on schema perfection.
 - strict validation for normal docs
 - tolerant fallback path for ERROR ack
5. Add tests/docs for this pass:
 - one PO per file enforcement
 - SFTP port 50022 config/default behavior
 - no temp rename behavior
 - ERROR ack parsing and canonical failure mapping

Defer to the next pass

After the above is working, then tackle:

- Dealer Attention fallback
- multi-shipment correlation improvements
- broader batched invoice/correlation hardening
- expanded runbook/tests

Direct answers to the flagged issues

1. Duplicate SPR implementations:
 - PartnerAdapters/SPR/Xml is the authoritative live path
 - remove/deprecate legacy duplicates after verifying references

2. Schema placeholders:

- use real provided XSDs for standard validation
- implement ERROR ack with tolerant fallback parsing, not blocked by strict XSD validation
- keep raw archive + actionable error extraction

3. Underlying flow not connected:

- wire the minimal real outbound/inbound path now so this alignment pass can be validated end-to-end

Before coding, show me:

A. exact files/classes you will touch

B. which live path you are keeping

C. how ERROR ack fallback parsing will work if strict XSD validation fails

Then implement.

Defer Dealer Attention fallback for this pass.

Keep PO number as the primary correlation key right now.

Do **not** invent Dealer Attention from ship-to name, bill-to name, or other loose fields, and do **not** change the frozen intake contract for this pass.

Design the correlation logic so that PO + Dealer Attention can be added later once we confirm the true source field in M360 and thread it intentionally through the contract.

A: use real standard XSDs where available, but build ERROR ack with tolerant fallback because no sample exists yet

B: defer Dealer Attention fallback for now; use PO number only in this pass
